CASH VALVES TYPE G-60
HIGH CAPACITY PRESSURE REGULATOR

The Type G-60 is a high capacity all purpose regulator designed to operate within close operating limits.

Application

Type G-60 regulators are designed for use with steam, water, air, oil, gases, chemicals or other fluids. These regulators are available with either iron, bronze, carbon steel, or stainless steel bodies and feature a variety of internal materials for a wide range of applications. Available in 1/4" through 1 1/2" sizes with threaded connections. These valves are designed for a variety of inlet pressure ranges and operating temperatures depending on construction materials used. Refer to the Spring Range Table or the Pressure and Temperature Ratings Table under Specifications for additional information.

The Type G-60 regulator is suitable for use in dryers, steam atomized oil burners, plastic molding, cookers, degreasers and sterilizers. Also available for cryogenic service (Page 3).

Description

The Type G-60 is a high capacity all purpose pressure reducing and regulating valve designed to reduce high inlet pressures to a lower outlet pressure and hold the reduced pressure within close limits. Type G-60 regulators are self-contained and self-actuated and are designed for high capacity systems where close control is required.

Features

- **Sizes:** 1/4", 3/8", 1/2", 3/4", 1", 1 1/4", and 1 1/2" with threaded connections.
- **Optional Stainless Steel Internal Trim:** The Type G-60 can be furnished with stainless steel internal trim suitable for regulating steam, air, water, oil, gases, chemicals, and other fluids. Trim consists of the pusher post button, pusher post, guide bushing, piston orifice, nozzle and bottom cap. It is an excellent choice for any pressure reducing valve application...but particularly possessing the qualities necessary for those tough jobs where high capacity and the need for close regulation rule out all but the best regulators.
- **Adjusting Screw:** A hex head adjusting screw and hex lock nut are standard. An optional T-bar is available on special order.
- **Internal Design Features:**
  1. The valve piston is fully balanced against inlet and outlet pressures, except for the Steam valves. This provides close control despite wide inlet pressure variations.
  2. A flat seat ring rather than a beveled seat is employed for better shut-off, higher capacity, and easier maintenance.
  3. The internal parts are well guided to assure proper seating.
  4. The Type G-60 has a large diaphragm and long pressure spring which, in combination, do two things – (1) provide for a wide range of adjustment and (2) give exceptional sensitivity of control.

Operation

The Type G-60 design is totally different from the majority of self-acting pressure reducing regulators. Note the cross section at right. Five pressure chambers play a part in producing the high capacity and exceptional performance of the Type G-60.

Flow from inlet chamber (A) goes through the seat orifice to intermediate chamber (B), then into the outlet line (F) through nozzle chamber (C). Control chamber (D) communicates with outlet line (F) through chamber (E). In operation, assuming the valve closed, a drop in pressure in line (F) caused by demand downstream, simultaneously drops the pressure in chambers (E) and (D). As this produces some valve opening, pressure in chamber (B) will considerably elevate the velocity of flow through nozzle (C). This increased velocity through the nozzle (jet action) drops the pressure in control chamber (D). The valve is opened wide to satisfy the demand and the delivery pressure is maintained within narrow limits.

Construction

Body: Iron, bronze, carbon steel or stainless steel (Type 316 or 316L).

Trim: Bronze or stainless steel (Trim consists of pusher post button, pusher post orifice, nozzle, bottom cap, and piston).

Guide Bushing: Stainless steel.

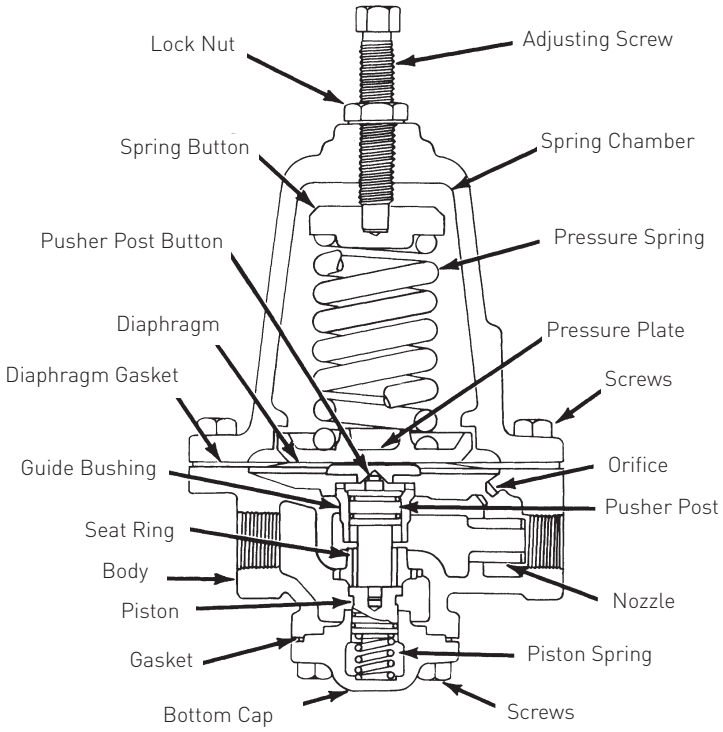
Piston and Seat Ring: Stainless steel – for steam and other fluids requiring metal-to-metal seats. Bronze piston with BUNA-N seat disc and stainless steel seat ring – for air, cold water, and other fluids where tight shut-off is desired, stainless steel pistons are optional.

Diaphragm: Phosphor bronze, stainless steel, BUNA-N, Viton®

Diaphragm Gasket (used only with metal diaphragms): Aramid Fiber (Teflon® on special order)

Bottom Cap Gasket: Aramid Fiber (Teflon® on special order)

Adjusting Screw Cap (when furnished): Brass (Stainless Steel on special order).

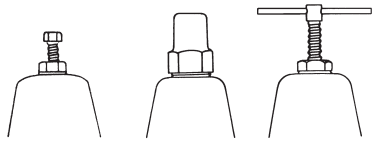


Type G-60 Interior Steam Regulator

Features

Adjusting Screw

A hex head adjusting screw and hex lock nut are standard. An optional T-bar is available on special order.



Options

Optional Cryogenic Service

Approved construction is offered in the Type G-60 for handling cold fluids. For example, pressure building regulators on liquid to gas oxygen and nitrogen converters. Special stainless steel pressure springs for higher ranges than those shown in the Spring Range Table are available for this service. Write for Data sheet CAVMC-0514 for more information.

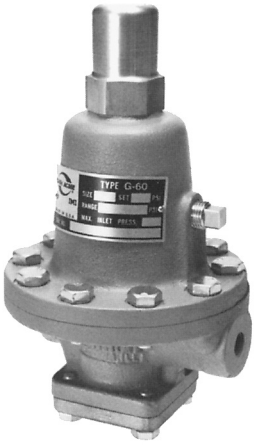
Internal Design Features

1. The valve piston is fully balanced against inlet and outlet pressures, except for the Steam valves. This provides close control despite wide inlet pressure variations.
2. A flat seat ring rather than a beveled seat is employed for better shut-off, higher capacity, and easier maintenance.
3. The internal parts are well guided to assure proper seating.
4. The Type G-60 has a large diaphragm and long pressure spring which, in combination, do two things – (1) provide for a wide range of adjustment and (2) give exceptional sensitivity of control.

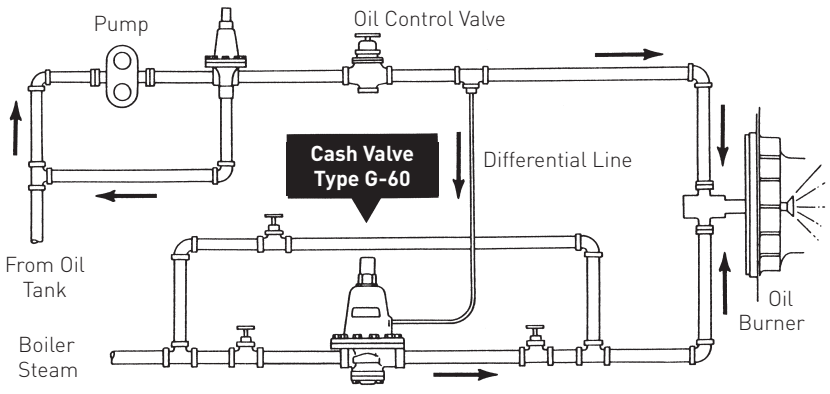
Optional Differential Pressure Control

The Type G-60 can serve as a constant-differential valve through a slight modification of the standard valve design. This is accomplished by incorporating a 1/4" side tap in the spring housing. In the typical steam/oil atomizing installation sketch below, loading pressure is introduced above the G-60 diaphragm and steam is delivered through the valve at a regulated pressure higher than the loading pressure, with the pressure difference being determined by the diaphragm spring setting. The outlet steam pressure is automatically maintained to provide a constant, fixed pressure differential between the steam pressure and oil pressure. Variations in the loading pressure are reflected in a pound-for-pound change in the discharge pressure.

Valves equipped with the optional differential pressure control are fitted with a pressure-tight closing cap over the pressure adjusting screw. In addition, a gasket is installed above the diaphragm and the closing cap has a gasket seal.



Type G-60 Differential Valve



Steam/Oil Atomizing Control

1 1/2"	5-15	10-50	30-75	50-120	75-150	

Note: Spring options in Stainless Steel and for ranges to 600 psig are available on special order.

Specifications (Continued)

The amount of air or fluid any regulator will pass is governed by two factors; (1) pressure differential, or the difference between the inlet and outlet pressure, and (2) a characteristic known as fall-off or droop, by which the outlet pressure drops slightly as flow starts through the valve and drops off even more as increased demand requires increased flow. The rates of flow stated on the following charts are based on maximum fall-off on droop of 20% from set pressure.

How To Order

To order, specify Cash Valve type by specific series designation (i.e. Type G-60).
Also state the following:

1. Valve size
2. Service (water, air, oil, etc.)
3. Inlet pressure
4. Outlet or delivery pressure range and setting
5. Maximum required flow rate
6. System operating temperature
7. Optional features, if any, as described for a specific valve.
